                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  pneumoniae (particularly meningitis) but possibly also Helicobacter pylori (ulcers and gastric cancer). It may be of particular use before insertion of an in-dwelling device or any other invasive procedure. The protein, or nucleic acid encoding it, can also be used in vaccines to induce a cellular and/or humoral immune response, or to screen for other antibacterials. The DNA may also contain flanking sequences that are potential sources of control elements for bacterial gene expression. Detecting a sequence encoding the protein can be used diagnostically, e.g. to detect a mutation for serotyping or classifying infectious agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Listeriolysin 0; haemolytic; domain; streptolysin 0; pneumolysin; soluble molecular complex; specific; targetted; polynucleotide; endosome lysis; bacterial component; cytoplasm; therapeutic; in vivo; ex vivo; in vitro; delivery; cell specific; hemolytic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure; Page 6-7; 12pp; German.

The claimed signal peptide encoding sequence (see tag e of T08695) is pref. operably linked at the 3' end to a protein encoding sequence. The protein is pref. the S-layer protein (see tag f of T08695). At the 5' end, the signal peptide encoding sequence is pref. linked to an expression control sequence, pref. the sequence given in T08696.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              318 S-RFTADHPGLPISYTTSFLRDNVVATFQNSTDY-VETKVTAYRNG 361

PT Helicobacter pylori nucleic acid sequences and encoded prolypeptide(s) - useful in vaccines to treat or prevent H. pylori prolypeptide(s) - useful in vaccines to treat or prevent H. pylori infection and for diagnosis of H. pylori infection

CC Claim 14; Page 571; 1145pp; English.

CC This sequence is a H. pylori protein of unspecified function.

CC This sequence is a H. pylori protein of prevent or treat H. pylori compounds, and probes derived from it may be used for the identification of the pylori in a sample and the diagnosis of H. pylori infection. Nucleic can be used to prevent the translation of H. pylori infection. Nucleic can be used to prevent the translation of H. pylori mRNA. Antibodies and against the protein can be used in immunoassays to evaluate the abundance can be used in the protein can be used in immunoassays to evaluate the abundance of by mechanically shearing the bacterial DNA. The sequences were analysed can defined by computer evaluation. To identify likely H. pylori antigens for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Qγ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁

Claim 1: Pages 9-14; 31pp; German.

Crace The present sequence is the Bacillus stearothermophilus pv72

Claim 2: Payer protein, sbs-A. S-layer structures can be used as vaccines or adjuvants, particularly when they include a bacterial ghost that crecombinant sbs-A, depending on the nature of the inserted peptide, crecombinant sbs-A, depending on the nature of the inserted peptide, care as an universal carrier for biotinylated reactants for use in conduce immune responses (epitopes), as a reagent for removing contains and recombination assays (the insert is streptavidin), and the contains of the insert is streptaviding contains and carrier for series of the insert is streptavidin).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytoplasmic; vaccine; prevention; treatment; infection; envelope; identification; binding compound; bacteria; life cycle; activator inhibitor; duodenal ulcer disease; chronic gastritis; diagnosis.

                                                                                                                                                                                                                                                      PT of meningitis

PS Claim 1; Page 71-72; 130pp; English.

CC The sequence is that of the polypeptide encoded by a region isolated CC The sequence is that of the polypeptide encoded by a region isolated CC The sequence is that of the polypeptide encoded by a region isolated CC phosphorylase. It, or agonists of it, may be useful as an anti-

CC phosphorylase. It, or agonists of it, may be useful as an anti-

CC phosphorylase. It, or agonists of it, may be useful as an anti-

CC phosphorylase. It, or agonists of it, may be useful as an anti-

CC phosphorylase. It, or agonists of infection, specifically caused by 5, pneumoniae (particularly meningitis) but possibly also Helicobacter CC pylori (ulcers and gastric cancer). It may be of particular CC use before insertion of an in-dwelling device or any other CC invasive procedure. The protein, or nucleic acid encoding CC invasive procedure. The protein, or nucleic acid encoding CC antibacterials. The DNA may also contain flanking sequences CC that are potential sources of control elements for bacterial CC gene expression. Detecting a sequence encoding the protein CC can be used diagnostically, e.g. to detect a mutation for CC can be used diagnostically, e.g. to detect a mutation for CC commence 7940 An.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. colimers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence

Helicobacter pylori nucleic acid sequences and encoded Helicobacter pylori nucleic acid sequences and encoded problement pyloride(s) - useful in vaccines to treat or prevent H. pylori polypeptide(s) - useful in vaccine to prevent or treat H. pylori cellular protein.

CC This sequence is a H. pylori cellular protein.

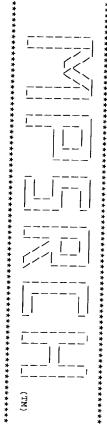

CC The protein may be used in a vaccine to prevent or treat H. pylori cellular protein are protein as potential H. pylori life cycle activators or inhibitors. The CC useful as potential H. pylori life cycle activators or inhibitors. The CC DNA and probes derived from it may be used for the identification of CC acid sequences complementary to the DNA act as antisense sequences and CC against the protein can be used in immunoassays to evaluate the abundance against the protein can be used in immunoassays to evaluate the abundance CC and distribution of H. pylori-specific antiquens. The genomic sequence of CC and distribution of H. pylori-specific antiquens. The genomic sequence of CC and distribution of H. pylori-specific antiquens. The genomic sequence of CC and colly shearing the bacterial DNA. The sequences were analysed CC interest, particular regions and the predicted coding regions for CC defined by computer evaluation. To identify likely H. pylori antiquens for vaccine development, the amino acid sequences predicted from various ORF content of the proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli
                                                                                                                                                                                                                                                                                              Ϋ́

Disclosure; Column 47-50; 30pp; English
A genetic defect linked to pl1-p21 of the x chromosome, especially
mutation C936T in exon 8 of the monamine oxidase (MAD) gene is related
abnormal behaviour. MAD metabolises serotonin, dopamine and
noradrenaline, neurotransmitters whose metabolism is known to affect
behaviour. Disregulation of these transmitters leads to borderline
mental retardation and abnormal behaviour (including impulsive
aggression). Probes based on the mutated sequence can be used for the
                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                       false transmitters.

1:pir1 2:pir2 3:pir3 4:pir4

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 50.333; Variance 110.368; scale 0.456

#title The MAS-encoded processing protease of yeast mitochondria.

Interaction of the purified enzyme with signal peptides
a purified precursor protein.

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Tabular output not generated. Run on: Mon Aug 30 15:58:43 1999; MasPar time 14.67 Seconds 907.846 Million cell updates/sec

Sequence: Description: Perfect Score: >US-09-120-044-3-COPY (1-471) from devil20044.pep 3241 1 MANKAVNDFILAMNYDKKKL.....TISIWGTTLYPQVEDKVEND 471

Scoring table: РАМ 150 Gap 11

Post-processing:

77977 seqs, 28268293 residues

Minimum Match 0% Listing first 45 summaries

Database: swiss-prot37 1:swissprot

Statistics: Mean 51.515; Variance 97.371; scale 0.529

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RT.	of Streptococcus pneumoniae.";
æ	INFECT. IMMUN. 55:1184-1189(1987).
റ്റ	-!- FUNCTION: SULFHYDRYL-ACTIVATED TOXIN. IS ABLE TO LYSE CHOLESTEROL
റ്റ	CONTAINING MEMBRANES. CAN BE REVERSIBLY INACTIVATED BY OXIDATION.
S	CHOLESTEROL IS THE RECEPTOR FOR THE BINDING OF THESE TOXINS TO
දු	EUKARYOTIC CELL MEMBRANES.
ဌ	-!- SIMILARITY: BELONGS TO THE THIOL-ACTIVATED CYTOLYSIN FAMILY.

LISTERIOLYSIN O PRECURSOR (THIOL-ACTIVATED CYTOLYSIN).
HLY OR LISA OR HLYA.
                                                                                                    VINES A., SWAMINATHAN B.;

SUBMITTED (JUL-1995) TO EMBL/GENBANK/DDBJ DATA BANKS.

SUBMITTED (JUL-1995) TO EMBL/GENBANK/DDBJ DATA BANKS.

-i- FUNCTION: SULFHYDRYL-ACTIVATED TOXIN. IS ABLE TO LYSE CHOLESTEROL CONTAINING MEMBRANES. CAN BE REVERSIBLY INACTIVATED BY OXIDATION.

CHOLESTEROL IS THE RECEPTOR FOR THE BINDING OF THESE TOXINS TO EUKARYOTIC CELL MEMBRANES.

FUNCTION: SULFHYDRYL-ACTIVATED TOXIN. IS ABLE TO LYSE CHOLESTEROL CONTAINING MEMBRANES. CAN BE REVERSIBLY INACTIVATED BY OXIDATION. CHOLESTEROL IS THE RECEPTOR FOR THE BINDING OF THESE TOXINS TO EUKARYOTIC CELL MEMBRANES (BY SIMILARITY).
FUNCTION: HEMOLYTIC ACTIVITY AGAINST RED BLOOD CELL.
SIMILARITY: BELONGS TO THE THIOL-ACTIVATED CYTOLYSIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        NDSRLYPGALLVVDETLXENNPTLLAVDRAPMTYSIDLPGLASSDSFLQVEDPSNSSVRG
